

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A computerized system for the decentralized storing and publishing of encryption keys for an electronic encryption system that sends encrypted transmissions between a sender's e-mail account and a recipient comprising:

a first computer readable medium having a first communications connection for electronic communications over a network;

a first storage area embodied within said first computer readable medium;

a second computer readable medium having a second communications connection for electronic communications over a network for providing electronic communications with said first computer readable medium;

a second database having a second set of public keys embodied in said second computer readable medium;

a first set of computer readable instructions embodied within said first computer readable medium for:

intercepting an electronic message generated from the sender's e-mail account that is to be encrypted,

receiving generating a first request for a recipient's public key according to said intercepted electronic message; from the sender through said first communications connection,

querying said first storage area for the requested recipient's public key;

encrypting said intercepted electronic message according to ~~transmitting the~~  
recipient's public key ~~to the sender~~ if the recipient's public key is found within said first  
storage area, and,

if the recipient's public key is not found in said first storage area, transmitting a  
second request for the recipient's public key to said second computer readable medium,  
retrieving the recipient's public key from said second computer readable medium,  
transmitting the recipient's public key to said first computer readable medium ~~if the~~  
~~recipient's public key is not found in said first storage area~~ so that the first computer  
readable instructions can encrypt said intercepted electronic message ~~the sender is~~  
~~either provided~~ with the recipient's public key located in the distributed storage system  
~~or said second request is sent to said second computer readable medium requesting~~  
~~the recipient's public key.~~

2. (Currently Amended) The system of claim 1 wherein:

said second communications connection allows for electronic communications  
with a root server; and,

a second set of computer readable instructions embodied within said  
second computer readable medium for:

receiving a ~~said second~~ request for the recipient's public key from said first set of  
computer readable instructions,  
querying said second database for the recipient's public key, transmitting the recipient's  
public key to said first computer readable  
medium if the recipient's public key is found in said second database,

transmitting an upstream request to said root server for the recipient's public key is not found in said second database;

receiving the recipient's public key if the recipients' public key is provided by said root server;

receiving a pointer to the recipient's public key if the pointer to the public key is provided by said root server; and,

retrieving the recipient's public key from a location provided by the root pointer to the recipient's public key if the pointer to the recipient's public key is provided to said first computer readable medium.

3. (Original) The system of claim 2 including:

a root computer readable medium having a root communications connection for communicating with the network and said second computer readable medium;

a root database embodied in said root computer readable medium containing pointers to all public keys of the encryption system;

a set of computer readable root instructions embodied in said root computer readable medium for:

receiving said upstream request from said second set of computer readable instructions,

querying said root database for the pointer to the recipient's public key,

transmitting the pointer of the recipient's public key to said second computer readable medium if the pointer to the recipient's public key is found within said root database, and,

transmitting a not found statement to said second computer readable medium if the pointer to the recipient's public key is not found in said root database so that the sender can be provided with the recipient's public key or the sender can be informed that the recipient's public key can not be found.

4. (Original) The system of claim 3 including:

said set of computer readable root instructions includes instruction for transmitting said key server address of the next key computer readable medium down the hierarchy having a pointer to the recipient's public key.

5. (Original) The system of claim 3 including:

a plurality of key computer readable mediums arranged in a hierarchy having public keys stored within said computer readable mediums;

a plurality of key server address associated with each of said key computer readable mediums representing the location of said key computer readable mediums within said hierarchy; and,

said set of computer readable root instructions includes instruction for transmitting said key server address of the next key computer readable medium down the hierarchy having the recipient's public key.

6. (Original) The system of claim 2 including:

a root server cluster having a root computer readable medium and a root communications connection for communicating with the network and said second computer readable medium;

a root database embodied within said root server cluster containing pointers to all of the public keys of the encryption system;

a set of computer readable medium root instructions embodied in said root server cluster for:

receiving said upstream request from said second set of computer readable instructions,

querying said root database for the requested recipient's public key,

transmitting the recipient's public key to said second computer readable medium if the recipient's public key is found within said root database, and,

transmitting a not found statement to said second computer readable medium if the recipient's public key is not found in said root database so that the sender can be provided with the recipient's public key or the sender can be informed that the recipient's public key can not be found.

7. (Original) The system of claim 1 wherein said first set of computer readable instructions includes instruction for:

receiving the recipient's public key from said second computer readable medium if the recipient's public key is found within said second database; and,

transmitting the recipient's public key to the sender if the recipient's public key is received from said second computer readable medium so that the sender may encrypt a transmission with the recipient's public key.

8. (Original) The system of claim 7 wherein said first set of computer readable instructions includes instruction for storing the recipient's public key within said first computer readable medium upon receipt of the recipient's public key so that the recipient's public key is available upon subsequent requests received for the recipient's public key.

9. (Currently Amended) The system of claim 1 including:

a temporary storage section contained within said first computer readable medium; and,

said first set of computer readable instructions include instruction for: receiving the recipient's public key from said second computer readable medium if said second computer readable medium provides the recipient public key; and,

storing the recipient's public key within said temporary storage section upon receipt of the recipient's public key from said second computer readable medium so that the recipient's public key is available from said temporary storage section according to the subsequent request for the recipient's public key.

10. (Original) The system of claim 9 wherein said first set of computer readable instructions include instruction for deleting the received recipient's public key from said temporary storage section upon the expiration of a predetermined period of time.

11. (Original) The system of claim 9 wherein said first set of computer readable instructions include instruction for deleting the received recipient's public key from said temporary storage section according to a set of predetermined criteria.

12. (Currently Amended) A computerized system for the decentralized storing and publishing of encryption keys for an electronic encryption system for sending encrypted transmissions between a sender's e-mail account and a recipient comprising:

a first computer readable medium;

a communications connection in communication with said first computer readable medium for transmitting and receiving electronic information on a network;

a database embodied in said first computer readable medium having public keys;  
a set of computer readable instructions embodied in said first computer readable medium for:

intercepting an electronic message generated from the sender's e-mail account that is to be encrypted,

generating receiving a request from a requester for the recipient's public key according to said intercepted electronic message,

querying said database for said recipient's public key,

retrieving transmitting said public key to the requester if the recipient's public key is found in said database and encrypting said intercepted electronic message according to said recipient's public key; and,

if said public key is not found in said database, transmitting an upstream request to an upstream server for the recipient's public key, retrieving the recipient's public key from said upstream server, transmitting the recipient's public key to said first computer readable medium if said public key is not found in said database so that said first set of computer readable instructions can encrypt said intercepted electronic message according to sender is either provided with the recipient's public key retrieved from the decentralized storage system.

13. (Original) The system of claim 12 including:

a root computer readable medium having a root communications connection for communicating with the network and said first computer readable medium;

a root database containing pointers to all public keys of the encryption system;

a set of computer readable root instructions embodied in said root computer readable medium for:

receiving an upstream request for the recipient's public key to said computer readable medium,

transmitting the pointer to the recipient's public key from said first

computer readable medium if the pointer to the recipient's public key is found within said root database, and,

transmitting a not found statement to said computer readable medium if the pointer to the recipient's public key is not found in said root database.

14. (Original) The system of claim 12 including:

a root computer readable medium having a root communications connection for communicating with the network and said first computer readable medium;

a plurality of key computer readable mediums arranged in a hierarchy having public keys stored within said key computer readable mediums in communication with said root computer readable medium and said first computer readable mediums;

a plurality of key server addresses associated with each of said computer readable mediums representing the location of said key computer readable mediums within said hierarchy; and,

a set of computer readable root instructions embodied in said root computer readable medium for:

receiving an upstream request for the recipient's public key,

querying said root computer readable for the recipient's public key; ;and,

transmitting the key server address of the next key computer readable medium down the hierarchy if the recipient's public key was not found within said root computer readable medium.

15. (Original) The system of claim 14 wherein said computer readable instructions include instruction for transmitting a final request to a location according to receiving the pointer of the recipient's public key so that said computer readable instructions can discover the recipient's public key at the pointer location.

16. (Original) The system of claim 15 having a root server cluster embodying said root computer readable medium.

17. (Original) The system of claim 12 including:  
a temporary storage section contained with said computer readable medium; and,

said set of computer readable instructions include instruction for:  
receiving the recipient's public key from said upstream server, and,  
storing the recipient's public key within said temporary storage section upon receipt of the recipient's public key from said upstream server so that the recipient's public key is available to said computer readable medium.

18. (Currently Amended) A computerized system for the decentralized storing and publishing of encryption keys for an electronic encryption system that sends encrypted transmissions between a sender and a recipient comprising:

a first computer readable medium having a first communications connection for electronic communications over a network;

a second computer readable medium having a second communications connection for electronic communications over a network for providing electronic communications with said first computer readable medium;

a database having a set of public keys and public key address pointers embodied in said second computer readable medium;

a first set of computer readable instructions embodied within said first computer readable medium for:

intercepting an electronic message generated from the sender's e-mail account that is to be encrypted,

generating receiving a request for a recipient's public key according to said intercepted electronic message ~~from a requester through said first communications connection,~~

querying said first computer readable medium for the requested recipient's public key;

querying said first computer readable medium for the address pointer if the recipient's public key if the recipient's public key was not found,

generating ~~transmitting~~ a second request ~~to said second database~~ for the requested recipient's public key if said address pointer of the recipient's public key or the recipient's public key was not found,

transmitting said second request to said second database,

receiving the recipient's public key if the recipient's public key is found on said database,

receiving the pointer to the recipient's public key if the pointer of the recipient's public key is found on said database,

receiving the recipient's public key according to the address pointer if the recipient's public key is received, and,

transmitting the recipient's public key to said first computer readable medium the sender if the recipient's public key is received; so that said first set of computer readable instructions can encrypt the intercepted electronic message according to the received recipient's public key.

19. (Original) The system of claim 14 including:

a root computer readable medium having a root communications connection with said network, first computer readable medium and second computer readable medium;

a root database containing address pointers to all public keys of the encryption system;

a set of computer readable root instructions embodied in said root computer readable medium for:

receiving the request for the address pointer of the recipient's public key from said first set of computer readable instructions,

querying said root database for the pointer to the recipient's public key,

transmitting the pointer to the recipient's public key to said first computer readable medium if the address pointer to the recipient's public key is found within said root database so that the sender can be provided the public key of the recipient to send an encrypted message, and,

transmitting a not found statement to said first set of computer readable instructions so that the sender can be informed that the recipient's public key can not be found.

20. (Original) The system of claim 18 where said first set of computer readable instructions include instruction for storing the address pointer of the recipient's public key within said first computer readable medium so that said first set of computer readable instructions can retrieve the recipient's public key according to subsequent requests for the recipient's public key.

21. (Original) The system of claim 19 wherein said received address pointer of the recipient's public key is removed from said first computer readable medium according to predetermined criteria.
